Tesla[™] TI60 MPU-24 User Manual

Built Smart...Proven Tough

Tesla Industries, Inc.

101 Centerpoint Blvd. New Castle, DE 19720 (302) 324-8910 Phone (302) 324-8912 Fax www.teslaind.com www.tesla1.com

NOTE: All users must read this entire manual prior to operating the TI60 MPU-24.

The TI60 MPU-24 is a limited maintenance-free and sealed unit. No repairs are authorized. Warranty will be voided if unit is tampered with in any way, or if unauthorized repairs are made. For technical support please contact:

TESLA™ INDUSTRIES INCORPORATED

101 CENTERPOINT BLVD. CENTERPOINT INDUSTRIAL PARK, NEW CASTLE, DELAWARE 19720 PHONE: (302) 324-8910 FAX: (302) 324-8912

Shock Hazard Potential

Improper use or failure to follow instructions in this user manual can result in unit damage and/or injury or death by electrical shock.

Any attempts to open or examine the inside of the unit via a tool or device (borescope, probe, etc.) can result in unit failure and/or injury by electrical shock. This MPU is maintenance free and should not be opened or disassembled for any reason.

Always protect the unit from short circuit.

Shipping Hazards: The unit contains sealed, dry cell rechargeable batteries that do not pose a shipping hazard.

All Ground Power Units, Micro Power Units (Aviation Batteries) and including, but not limited to, Battery Chargers/ Conditioners, manufactured by Tesla[™] Industries, Inc., are able to safely and effectively charge any AGM, Lead Acid battery.

The Tesla[™] GPU's and chargers are voltage and current regulated to 0.01% (dual loop). The charging voltage is calibrated, by Tesla[™], to 28.6 volts and is pure dc (no power line ripple).

Maximum Charge Voltage by Battery Type

Туре:	Charging Voltage / Cell	Charging Voltage / 12v	Charging Voltage / 24v
SLI/Flooded	2.366v to 2.416v	14.2v to 14.5v	28.4v to 29v
Lead Acid/Flooded	2.366v to 2.416v	14.2v to 14.5v	28.4v to 29v
Sealed Lead Acid	2.366v to 2.416v	14.2v to 14.5v	28.4v to 29v
VRLA	2.366v to 2.416v	14.2v to 14.5v	28.4v to 29v
AGM	2.433v to 2.466v	14.6v to 14.8v	29.2v to 29.6v
GEL	2.350v to 2.400v	14.1v to 14.4v	28.2v to 28.8v

UAV	Unmanned aerial vehicle
Vac	Volts, Alternating Current
Vdc	Volts, Direct Current
W	watts

Section 1 – Safety Review

1.1 - Safety Notices

Safety notices appear throughout this manual to alert the user to important information regarding proper installation, operation, maintenance and storage of the unit. These notices, as illustrated below, contain a key word that indicates the level of hazard and a triangular icon that indicates the specific type of hazard.

/ WARNING	Indicates a condition, operating procedure or practice, which if not adhered to could result in serious injury or death.
CAUTION	Indicates a condition or operating procedure, which if not strictly adhered to could result in damage or destruction of equipment.
NOTE	Indicates a condition, operating procedure or practice, which is essential to highlight.

1.2 - Symbols

The following symbols will appear within the warning triangles to alert the user to the specific type of danger or hazard.

Explosion Hazard

Figure 1.2.1 - Different types of hazard and caution symbols

1.3 - Hazards

🏀 WARNING

Shock Hazard Potential

Severe injury or death from electrical shock may occur, if either user or the unit is wet, while the unit is connected to a power source. If the unit has come into contact with water, disconnect ac power from the ac source. If AC Input Circuit Breaker has tripped due to water infiltration, DO NOT try to reset it with the ac line voltage attached.

Shock Hazard Potential

Severe injury or death from electrical shock can occur when damp electrical plugs are connected to the unit. Before making any connections, turn off unit. Failure to use proper grounding can cause potential shock hazard! In different countries, the power cord may require the use of a plug adapter to achieve plug style compatibility for operation. Use only adapters with proper grounding mechanism.

Figure 1.3.1 – Proper Ground Grounded Plug with Grounding Pin

Figure 1.3.2 – Proper Ground Adapter with Grounding Mechanism (Secured to Outlet)

Figure 1.3.3 – Improper Ground Plug with No Grounding Pin

Unit Damage Potential

The unit's charger temperature switch automatically disables the unit when the internal temperature exceeds 150°F (65°C). This protects the unit from overheating and damage. If the unit shuts down, move the unit into a cooler environment such as shade or air conditioning when possible. Perform a full function test, after the unit has been allowed to cool, prior to use.

1.4 - Important Safety Precautions

Fire/Explosion Hazard Potential

Severe injury or death from fire or explosion can occur if electrical sparks are produced near fuel vapors. DO NOT CONNECT 120 or 240 Vac Power Supply WHILE FUELING. Do not charge the MPU using a 120-240 Vac Power during any fuel handling operation. Power output is restricted to 24 Vdc power only.

Section 2 – Product Overview

2.1 – Introduction

Thank you and congratulations on the purchase of your new TI60 MPU-24.

This manual contains the complete operating instructions and procedures for the TI60 Micro Power Unit. The TI60 MPU-24 provides dc electrical ground power for aircraft flight line and maintenance ground support operations. The unit is designed to provide 24 volt dc electrical power output for aircraft engine starting and 24 or 28.5 volts dc electrical support for ground maintenance, avionics/electrical trouble shooting and testing. The observance of procedures, limitations and performance criteria ensures peak operating efficiency and maximizes operational capabilities and life of the TI60 Micro Power Unit.

The TI6O's high capacity power cells and circuity are encased in a rugged enclosure, and are designed to replace the original battery for the M134 Dillon Minigun. The internal circuitry incorporates an intelligent recharging system that allows the MPU to recharge from either the aircraft generator or from a standard 110 Vac or 220 Vac power source. The unit is also equipped with a built-in capacity meter that also serves as a recharge state indicator.

Figure 1.1.1 - TI60 MPU-24

2.2 - Indication of Terms: Shall, Should and May

Within this technical manual the word "shall" is used to indicate a mandatory requirement for proper operation and warranty purposes. The word "should" is used to indicate a non-mandatory but preferred method of accomplishment. The word "may" is used to indicate an acceptable method of accomplishment.

2.3 - General Specifications

Electrical

AC Input Power:

- Operates and charges from single phase 100-260 Vac 45-450 Hz
- 5.5 amps @ single phase 120 Vac
- 2.75 amps @ single phase 240 Vac

DC Output Power:

- 750 peak starting amps
- 10 amps continuous @ 28.5 Vdc (when plugged into ac power)
- 21.5 amp hours (541 watt hours) with ac power
- 11.5 amp hours (256 watt hours) of rechargeable battery power without ac

Recharge Rate From Full Discharge:

• 74 minutes @ 25°C

Size:

- 9.25" L x 7.13" W x 7.5" H
- 234.95 mm x 181.1 mm x 190.5 mm

Weight:

• 27.75 lbs (12.59 kg)

Operating Temperature:

- -40°C to +60°C (-40°F to 140°F) without ac power
- -40°C to +55°C (-40°F to 131°F) with ac power

Storage Temperature:

• -65°C to +105°C (-85°F to 221°F)

Cell Capacity:

- +40°C 110% ± 05%
- +25°C 100% ±05%
- +00°C 80% ± 05%
- -20°C 65% ± 10%
- -40°C 50% ± 10%

2.4 – Physical Dimensions

2.5 - Airflow Ports

The internal cooling system of the TI60 MPU-24 has been designed to efficiently regulate unit temperature regardless of load. At room temperature (+77 °F) the exhaust air will not exceed the ambient temperature by more than 5 °. In more extreme temperatures (greater than 90 °F), the exhaust air will not exceed the ambient temperature by more than 10 °.

Figure 2.5.1 – Air intake and exhaust ports and internal air circulation

2.6 - Operating Position

The TI60 MPU-24 should be operated in the position as shown (Figure 2.7.1). Make sure that the airflow is not obstructed from air intake (Figure 2.7.2) and outlet (Figure 2.7.3).

Figure 2.6.1 Airflow

TI60 MPU-24

2.7 - "Press for Capacity" Button and LED Status Indicator

The "Press for Capacity" button indicates the capacity of the power cells without applying ac input power. The status of the capacity lets the user know if there is enough power to perform another engine start. When the capacity is low the unit should be connected to ac power to allow it to recharge.

- **1.** Make sure that you wait at least 2 minutes after ac power is applied, or dc power is extracted from the unit, before you press the "Press for Capacity" button. This ensures a correct reading.
- 2. Without ac power input or dc power output, simply press the "Push to Test" button on the faceplate and hold for approximately 2 to 3 seconds.
- **3.** The LED bar graph should light up indicating the status of the power cells.
- **4.** In addition, the fan(s) should start operating when the button is pressed. If you do not hear the fan(s) running, stop pressing the button and check for any obstructions.

CAUTION Never press the "Press for Capacity" button while the unit is plugged into aircraft, vehicle or ac power.

Never press the "Press for Capacity" button for more than 5 seconds. This may cause a temperature sensor to temporarily disrupt "Press for Capacity" function. (If this sensor is tripped, allow ten minutes for unit to cool before operating "Press for Capacity" button.)

Figure 2.7.1 "Press for Capacity" button

Capacity % 100 90 80 70 60 50 40 30	Capacity % 100 90 80 70 60 50 40 30	Capacity % 100 90 80 70 60 50 40 30
Full Charge	Half Charge	No Charge

2.8 – Maintenance Check

Check the unit for dents, punctures, case distortion or misalignment, and cracked or loose connectors. Check cables for cuts, chafing or evidence of crushing. Check connectors for cracks, cuts, distortion, excessive wear, broken or loose fasteners, and cables or strain relieves. If no external damage is evident, proceed to next step. Otherwise contact Tesla[™] for further instructions.

2.9 – Pre-Installation Procedures

Removing Original Battery

Follow the aircraft's operator manual procedures to remove and dispose of the original aircraft battery properly and safely. Once the original battery has been removed from the battery compartment, proceed to the next step.

Check Unit Charge State

Before installing the TI60 MPU-24 into the aircraft, make sure the unit is fully charged. Remove the AC line cord from the AC Input Connector and wait two minutes. Then, push the "Press for Capacity" button to verify that the power cells are fully charged. Under a full charge the Capacity Meter will show a single green LED.

2.10 – Installation

Placing and Securing the Unit into the Aircraft.

With the battery compartment empty, maneuver the unit into position. Tilting the front of the unit upward, slide it forward and position it so the Back Mounting Flange slides underneath the receiving lip in the aircraft. Next, lower the front of the unit while making sure the mounting bolts line up with the slotted holes in the two Front Mounting Flanges. Finally, secure the Front Mounting Flanges with the original hardware while wedging the unit against the back mounting lip to ensure a snug fit.

Section 3 – Operating Procedures

3.1 – Operating Procedures

This section deals with normal procedures, and includes all steps necessary to ensure safe and efficient operation of the TI60 MPU-24.

NOTE	When the TI60 MPU-24 is not in use, it should always remain plugged into a suitable AC power source to insure operational readiness at all times.
NOTE	If current demand exceeds 10 amps, converter output voltage will drop below 28.5 Vdc and two or more LED status indicator bars will illuminate. If all LED status indicator bars illuminate, both the converter and power cells are supplying 24 Vdc power output.

3.2 - General

Correct operation of the TI60 MPU-24 includes both pre-use and operational checks of the unit. Knowledge of the operating limits, restrictions, performance, unit capabilities and functions is fundamental to correct and safe operation. The operator shall ensure compliance with the instructions in this manual that affect operational safety and the warranty of the unit.

3.3 – Operating Limits and Restrictions

The minimum, maximum and normal operating ranges result from careful engineering and evaluation of test data. These limitations must be adhered to during all phases of operation.

3.4 - Performance

Refer to Section 7, PERFORMANCE DATA to determine the capability of the TI60 MPU-24. Consideration must be given to changes in performance resulting from variations in ambient temperature, mode of operation, state of charge (with or without 120 or 240 Vac power), and aircraft dc bus system inefficiency (voltage drops).

3.5 – Engine Starting Power

Operators should always ensure the unit is charged above 80% prior to ground support engine starting. However, circumstances may exist during use where unit recharge is not readily available and immediate external engine starting power is required. The following provides minimum states of charge necessary to provide ample power for an efficient engine start under specific current load demands.

	The ambient temperature may cause the unit's protective "over-temperature"
NOTE	sensors to shut down the 120-240 AC functions (converter and charger)
•	until the unit cools to normal operating temperatures. If the unit shuts itself
	down, get the unit into a cooler environment such as shade or air conditioning
	(if possible). Perform a full function check prior to continued use once the
	unit is allowed to cool. For continued use in extremely hot environments, it
	is advised to send the unit back to Tesla™ for recalibration for use in these
	environments.
	chanterio.

NOTE	In the event that the temperature sensors do not shut the system down, extended use above specified limits may damage the unit. If the unit is operated when cold or heat soaked temperatures are exceeded, a full
	functional check should be accomplished prior to continued use.

ENGINE START PEAK CURRENT Requirements

300	peak starting amps	40% charged
375	peak starting amps	50% charged
450	peak starting amps	60% charged
525	peak starting amps	70% charged
600	peak starting amps	80% charged
675	peak starting amps	90% charged
750	peak starting amps	100% charged

MINIMUM CHARGE

3.6 – Temperature Specifications

Cold/Hot Soaked Temperature

Exposing the unit for one (1) hour or more to the ambient temperature establishes the unit's cold/hot soaked stabilization temperature. If the unit's cold/hot soaked temperature is outside the normal operating temperature range, the unit must be stabilized prior to operation. For COLD SOAKED temperature stabilization, the unit must be placed in an environment with a temperature above +10°C (+41°F) for 3 hours or a temperature above +20°C (+68°F) for 2 hours. For HOT SOAKED temperature stabilization, the unit must be placed in an environment with a temperature below +38°C (+100°F) for 1 hour.

Figure 3.6.1 – Output power capability versus ambient temperature

Hot Soaked or Cold Soaked Definition

Simple terms: When a material is exposed to a change in temperature, its temperature will also change. Some material changes temperature quickly, others slowly. If the ambient temperature changes and is then held constant, the materials temperature will also change until its temperature stabilizes. Once the material temperature has stabilized, it is considered "soaked".

Example: A unit is moved from the cool shade into the hot sun. That unit's temperature will increase until it stabilizes. Once stabilized, the unit would be considered "hot soaked".

3.7 – Environmental

If the unit is exposed to significant moisture, preventive measures and precautions shall be taken to:

- A. Prevent accumulation of moisture on ac and dc connectors/receptacles
- B. Minimize moisture entering forward inlet and outlet cooling fan vent ports

When not in use, unit inlet and outlet vent ports shall be covered from exposure. Unit shall be kept horizontal.

3.8 – Transporting Unit

The TI60 has a rugged nylon carrying strap permanently attached to the top of the unit to provide easy transport and placement into the aircraft. Be sure to check for frays prior to moving unit.

Figure 3.8.1 Nylon Carrying Strap

3.9 – Normal Function Test Procedures

This section involves "normal function" test procedures, and includes all steps necessary to ensure that the TI60 MPU-24 is operating within specified parameters prior to use. A digital multimeter (an example is shown in Figure 3.9.1) capable of measuring dc and ac voltage and resistance will be required to perform some of the tests. These functional test procedures should become routine.

Figure 3.9.1 - Digital Multimeter

Check Unit for Evidence of Damage

Check for dents, punctures, case distortion or misalignment, and cracked or loose connectors. If no damage is evident, proceed to the next step. If damage is evident, contact Tesla™ Industries, Inc.

Figure 3.9.2 - AC Input Connector wiring diagram

Check Unit Internal Resistance (Test for Shorts)

It is essential to test for shorts to detect any problems with the unit. First, set the multimeter to the "resistance". Next, test to see if both terminals are isolated from the chassis ground and the line ground using the steps below. In steps 2, 3, 5 and 6, a reading of greater than 10 M Ω will assure no shorts exist. In steps 1 and 4, the multimeter should read less then 1 ohm.

1. Place the negative probe on the ac ground probe (J or L) and the positive probe on an exposed part of the metal case.

2. Move the positive probe to the dc positive post on the DC Output Connector.

3. Move the positive probe to the dc negative post on the DC Output Connector.

 Move the positive probe to one of the four screws securing the DC Output Connector to the unit casing.

5. Move the negative probe to the dc negative post on the DC Output Connector.

6. Move the negative probe to the dc positive post on the DC Output Connector.

Check DC Voltage Reading at DC Receptacle Terminals

To verify that the power cells are fully charged, set the digital mulitmeter to measure dc voltage. Place the positive probe (red) on the positive post of the DC Output Connector, as shown in Figure 3.9.3. Next, place the negative probe on the negative post. The multimeter display should read approximately 28.5 Vdc (\pm 0.5 Vdc) when power cells are fully charged and the unit is plugged into an ac power source. When the unit is not plugged into an ac power source, the multimeter display should read 25.5 Vdc.

Figure 3.9.3 – Testing DC Receptacle

33

3.10 - Regulated 28.5 Vdc Ground Power

Connecting DC Power Cable To Unit

Ensure DC power cable plug is fully seated into the MPU's DC Battery Receptacle. Attaching a DC plug is quick and easy. Line up the plug with the receptacle. Push forward while rotating the T-handle one full turn clockwise. The unit is now ready to safely transfer power.

3.11 - Regulated AC Power

Plugging in with AC Power

When the TI60 MPU-24 is plugged into ac power, the output is 28.5 volts. This voltage allows the system to recondition and recharge the aircraft's battery(ies). It is also an optimum voltage for powering avionics and lighting on most aircraft. The MPU's ac to dc converter produces continuous amps of dc power depending on the size of the system.

Ensure 120 or 240 Vac power cord is properly connected to an approved ac power supply. After approximately 5-8 seconds, unit's LED status indicator will illuminate indicating power cell state of charge. Cooling fan will operate. Ensure LED status indicator and cooling fan is operational prior to continuing.

Figure 3.11.1 Connecting TI60 to AC Power Supply

Connect DC Power To Aircraft (Low Power Demand)

Low power demand is defined by a requirement of 10 amps or less. Connect dc power to aircraft ground power receptacle. DC bus power should come on and aircraft voltmeter should indicate 28.5 Vdc to 27 Vdc (26.5 Vdc minimum). If aircraft power demand is less than 5 amps converter output will remain at 28.5 Vdc (only one GREEN LED status indicator bar will illuminate). If aircraft power demand exceeds 10 amps converter voltage output will decrease and two or more LED status indicator bars will illuminate.

Connect DC Power To Aircraft (High Power Demand)

High power demand is defined by a requirement of greater than 10 amps. Connect to aircraft ground power receptacle. DC bus power should come on and aircraft voltmeter should indicate 28.5 Vdc to 23.5 Vdc (23 VCD minimum). If current demand is greater than 10 amps, converter output voltage will drop below 28.0 Vdc and LED status indicator lights will illuminate indicating current is being drawn from the power cells. The greater the current draw, the quicker the LED status indicator will approach red. Note the LED status indicator shows the status of the power cells.

When all LED status indicator bars illuminate, both the converter and power cells are supplying 24 Vdc power output for current demands above 10 amps.

Engine Starting

UNPLUG AC POWER CORD BEFORE STARTING ENGINE WITH TI60 MPU-24

Prior to engine start, ensure power cell charge is sufficient to provide an efficient engine start. Users should follow ground power engine starting procedures as specified in the aircraft's operator manual.

3.12 - Connect DC Power To Dillon M134 Minigun

Removing Original Battery

Follow the operator's manual procedures to remove and dispose of the original minigun battery properly and safely. Once the original battery has been removed from the battery compartment, proceed to the next step.

Check Unit Charge State

Before connecting the TI60 MPU-24 to the minigun, make sure the unit is fully charged. Remove the AC line cord from the AC Input Connector and wait two minutes. Then, push the "Press for Capacity" button to verify that the power cells are fully charged. Under a full charge the Capacity Meter will show a single green LED.

Connect DC Power To Dual Dillon M134 Miniguns

Using the optional TI2006-903 Y-Cable, the TI60 MPU-24 is capable of providing power to two Miniguns simultaneously. Connect the Minigun's dc wiring harness to the dc receptacle at the end of the TI2006-903 Y-Cable. Connect the Y-Cable's DC Connector to the TI60 (refer to section 5.7). The unit is now ready to safely transfer power.

Figure 3.12.1 TI2006-903 connected to TI60 MPU-24

3.13 - Charging Unit

Attaching AC Input Power

Before plugging the line cord into an ac outlet, attach and lock the mating plug to the AC Input Connector. Once accomplished, the unit can be plugged into an electrical outlet to begin charging. The Capacity Meter will immediately show the current charge state of the power cells. Make sure there is at least 2 to 3 inches of clearance in the front of the Air Exhaust Fan to provide for sufficient ventilation. If the unit is completely discharged, a minimum of 143 minutes will be required to fully recharge the unit.

Figure 3.13.1 AC Input Connector (outlined in blue)

Figure 3.13.2 Attaching AC Line Cord

LED and Fan Activity

Initially, several LEDs will be illuminated on the Capacity Meter. As the unit charges, the LEDs will go out one by one. Under full charge, the Meter will show either a single solid or pulsating green LED. In addition, the fan will be running at reduced RPM. This indicates that the unit is in standby mode and ready for use.

Section 4 – Post Operations

4.1 - General

Although the TI60 MPU-24 has been ruggedized and made weather resistant within the scope of unit's intended use, it is essential that good general care be taken to maintain unit in good operating condition and to maximize unit's operational life.

4.2 – After Use

Unit should be protected from environmental elements and man made hazards. Ideally unit should be secured in a building or shed. Most importantly, unit shall be fully covered if stored while exposed to environmental elements.

4.3 - Power Cell Recharge

When Installed in an operating aircraft, the TI60 MPU-24 will back-charge from the aircraft's dc power. Otherwise, the TI60 MPU-24 has an intelligent recharging system that will enable it to rapidly recharge when connected to an ac power source. If the unit's power cells become fully discharged, the unit should be recharged within 24 hours to ensure maximum life and performance. Under normal circumstances a minimum of 74 minutes will be required to fully recharge the unit.

Plug the TI60 MPU-24 into ac power to keep the cells charged whenever it is not in use, even if it is at Full Charge. The unit will not overcharge or overheat.

Connect AC Power Cord to Unit

Ensure 120 or 240 Vac power cord is properly connected to an approved ac power supply. After approximately 5-8 seconds, ensure unit's LED status indicator illuminates indicating power cell state of charge and cooling fan is operating.

Figure 4.3.1 Connecting TI60 MPU-24 to AC Power Supply

CAUTION

Guard From Incorrect Power Source

The TI60 MPU-24's power cells may be damaged if recharged by NiCad or Lead Acid-type battery chargers. Power cells should only be charged by either the TI60 MPU-24's internal charger and the ac power cord furnished with the equipment, or when connected to aircraft's external dc power receptacle.

Figure 4.3.2 Proper and Improper Charging Methods

Section 5 – Unit Care and Maintenance

Severe injury or death from electrical shock will occur if either the user or the unit is wet while operating the unit with an AC power source attached.

Damage may occur if an unapproved or modified AC line cable or input plug is attached to the MPU. Do not use any type of AC voltage converter.

5.1 - Unit Care

Avoid Prolonged Exposure to Extremely Damp Environments

Be sure to disconnect ac power from the ac source if the TI60 MPU-24 has come into contact with water. If the AC Input Circuit Breaker has tripped due to water infiltration, allow the unit to dry out before attempting to reset circuit breaker. Cover the unit to prevent water seepage. If the unit is operated in extremely damp conditions, it should be stored in an environmentally controlled building when not in use. Wipe unit clean periodically with a soft cloth to remove dust, dirt, etc.

Protect Cables from Damage

Do not cut, crush, or drag the input or output power cables when handling the TI60 MPU-24. Always inspect cables prior to use. If no damage is evident, proceed to the next step. If damage is evident, contact Tesla™ Customer Service. Do not attempt to use any other type of power cables other than the Tesla™ cables included with the TI60 MPU-24.

Figure 5.1.1 – Damaged cable

5.2 – Unit Servicing

This unit is a maintenance-free, sealed unit. No repairs outside of Tesla[™] are authorized. Warranty will be voided if unit is tampered with in any way including any damage to the WARRANTY VOID stickers located on the case (see Figure 5.2.1 below). If the unit requires maintenance, please contact Tesla[™] Customer Service at (302) 324-8910. A Repair Request Form can be found in the back of this manual.

Figure 5.2.1 – Warranty Void stickers Front and Back on the unit

5.3 – Packaging and Shipping

Ensure proper packaging when returning the unit. Transport the unit only in a sturdy shipping crate or Tesla[™] Shipping Case. It is important to enclose the Repair Request Form. Seal the crate on all sides and return it to Tesla[™] at the address listed below. Please contact Tesla[™] Customer Service at (302) 324-8910 with any questions or concerns.

TESLA™ INDUSTRIES, INCORPORATED 101 CENTERPOINT BLVD. CENTERPOINT INDUSTRIAL PARK NEW CASTLE, DELAWARE 19720

Section 6 – Frequently Asked Questions

1. Why should I buy a Tesla™ TI60 MPU-24?

Tesla[™] MPU has dramatic advantages over standard aircraft batteries. The advantages include power, durability, and longevity. A Tesla[™] MPU will provide more power for testing avionics and starting than comparable competitors. The dry cells are more resistant to heat and vibration. A Tesla[™] MPU does not experience thermal runaway. A Tesla[™] MPU is equipped with a built in intelligent charger.

2. Do the cells have memory?

The cells have no memory. The user can plug the TI60 MPU-24 into AC for charging regardless of the unit's current state of charge. The intelligent charger will keep a fully charged battery by trickle charging. Keeping a fully charged TI60 MPU-24 plugged into AC when not in use will prolong the life of the batteries.

3. How are Micro Power Units used in Aviation Support?

There are many ways a MPU will benefit your operation. By using it for pre-flight testing, you will avoid depleting the aircraft's battery. You can start the aircraft's engine with the MPU as well. In the hangar, when connected to AC power, the MPU will provide 28.5 Vdc for avionics testing and will also recondition and recharge the aircraft's battery.

4. How much power will my TI60 MPU-24 provide?

The MPU will provide up to 10 continuous amps with AC line voltage and 1500 peak starting amps directly from the internal cells.

5. How many engine starts will my MPU provide until it is depleted?

The MPU back-charges, almost instantly, once the aircraft is started and the generator is on line. This "power flywheel" feature enables the MPU to recharge itself right from the aircraft it started in less than 30 seconds.

6. How do you prolong the life of the TI60 MPU-24's cells?

All you need to do is plug the unit in to the appropriate AC power outlet the system requires. AC power will recharge the system and keep the cells healthy. Users who regularly plug the system in can expect to get 5-7 years from their cells before they need to be replaced.

7. Is it waterproof?

Water-resistant but not waterproof. See Section 3.7 for further information.

8. Why does the cooling fan run continuously when the MPU is plugged into AC power? Why does the cooling fan slow down?

The cooling fan speed varies to regulate the temperature of the internal circuitry when plugged into an AC power source.

9. Can one person transport it?

Micro Power Units are designed to be handled by one person. The TI60 MPU-24 provides a rugged nylon strap attached to the top of the unit that helps easily transport and place into the aircraft. See Section 3.8 for more information.

10. Is the TI60 MPU-24 in the government purchasing system?

Yes. Tesla[™] Industries is an approved vendor/supplier – our cage code is OVWE2. Most Tesla[™] products are class IX, have a National Stock Number (NSN) designation and can be acquired through the Defense Logistics Agency (DLA).

11. How long does this unit stay charged?

Unit should never be allowed to discharge fully. In-field use, it receives a dc back charge directly from a running engine. When not in use, unit should be plugged into ac power (outlet) all the time. Tesla™ systems will retain 80% of their capacity after one year of storage.

12. How do I get my TI60 MPU-24 serviced?

Contact Tesla[™] at (302) 324-8910. Ask for customer service. You can also email us at tesla1@teslaind.com. Once we receive the unit at our facility, we will examine it. Systems that are protected under warranty will be repaired at no charge. If the warranty has expired, you will receive a quote for necessary repairs prior to work being done. Our turnaround time is 48 hours once repairs are authorized.

13. Can I make my own repairs to unit?

During the warranty period, the unit can only be repaired by Tesla[™] Industries for the warranty to remain in effect. Regardless, we strongly recommend allowing Tesla[™] to repair any unit as we will analyze the complete system and recalibrate it.

14. What type of maintenance does the TI60 MPU-24 require?

Although the systems are maintenance free, please keep units plugged in while not in use. This will greatly extend the life of the cells. Also, keep the vent areas clean and free of debris. Keep units in a well ventilated area while charging. Keep the unit in a protected environment when not in use (maintenance facility, shed).

15. What is included with my TI60 MPU-24?

Customers receive an AC line cord for their home country and a full three year warranty.

16. Are there any HAZMAT issues or disposability problems?

There are none. Tesla™ will reclaim all battery cells for disposability purposes. Contact Tesla™ if you have questions.

6.2 - Basic Usage/Operation Questions

1. What's the best position to place the unit for use?

The only position for the MPU is the upright position for stability and airflow considerations.

2. Does the unit have to be plugged in all the time?

No, but for maximum performance and cell longevity, keep the unit plugged in while not in use.

3. What happens if I don't keep it plugged in?

Unit will eventually lose its charge and cell life is shortened.

4. How do I check the status of the charge?

Press the "Push to Test" LED bar indicator on the unit's faceplate. A fully charged unit will have one green LED light showing.

5. Why is the cooling fan always running when I am plugged into AC power?

Constant cooling fan operation ensures proper and consistent ventilation of the unit.

6. Why does the cooling fan slow down?

Cooling fan rpm varies for better temperature regulation.

7. Why does my LED flicker when the unit is plugged in?

Older Turbo Starts[™] indicated a full charge with a flickering LED readout. Newer models feature the illumination of one green bar on the LED readout when the unit is fully charged.

8. What do I do if a circuit breaker trips?

The AC input circuit breaker is located above the AC Input Connector. When the circuit breaker has been tripped, either of the red buttons will pop out. In the event that the breaker trips:

- 1. Disconnect the ac and dc connectors. (Unplug ac line cord on unit.)
- 2. Wait for a minimum of 60 seconds.
- 3. Reset breaker by pressing red button.
- 4. Reconnect ac and dc connections to the unit. (Plug in ac line cord on unit.)

The unit should power up automatically. If the breaker continues to trip, return the unit to Tesla™ Industries for repair.

Section 7 – Optional Accessories

7.1 – Tesla™ AC Line Cords

AC line cords come in several lengths or can be custom-ordered to fit your needs. Tesla[™] specializes in outfitting cables with a variety of connectors and junction boxes. Contact Tesla[™] customer service to find out more about our selection of cords.

Universal Line Cords

TI 25000-111	North American Line Cord 105-125 Vac 60 Hz 6.50 amps max NSN: 5935-01-576-4422 (CL IX)
